NEWS RELEASE - For Immediate Release

Northern Superior announces Inferred Mineral Resource Estimates at its Croteau Est Gold Property, West- Central Québec.

Highlights:

- Inferred Mineral Resource estimate for the central section (approximately 550m strike by 150m width) of the Croteau Bouchard Shear Zone (“CBSZ”) reported using a gold cut-off of 1.0 g/t Au totaling 11.6 million tonnes grading 1.7ppm Au, yielding 640,000 ounces of gold;
- The Inferred Mineral Resource estimate is based on 64 core drill holes (20,643 m);
- An exploration potential/target, ranging from 3.2 to 3.8 million tonnes, for a total of 122,000 to 270,000 ounces of gold, was identified by mineralization defined by single drillhole intersections (see cautionary language noted in the discussion below); and
- Mineralization occurs at surface, and remains open along strike in both directions (length defined thus far 1.1km) and at depth (only one hole to 575m vertical depth).

Sudbury, Ontario, January 14, 2016 - Northern Superior Resources Inc. (TSXV:SUP) (“Northern Superior” or the “Company”) reports that the Company has received a *National Instrument 43-101 – Standards of Disclosure for Mineral Projects (“NI 43-101”)* Technical Report dated September 28, 2015, prepared by Optiro Pty Limited (the "**Optiro Report**"), which includes Inferred Mineral Resource estimates (see Table 1) for the central part of the CBSZ. The CBSZ is located within Northern Superior’s 100% owned Croteau Est gold property, west-central Québec.

Table 1. Croteau Est September 2015 Mineral Resource appropriate for public reporting at 1.0 ppm gold cut-off.

Category	Tonnes (Mt)	Gold grade (Au g/t)	Gold ounces (Koz)
Inferred Mineral Resource	11.6	1.7	640

Due to the inherent sample support issues associated with including channel sample assay data into resource models, previously reported high grade assay values from several trench exposures across the central CBSZ were excluded from the Optiro Report and model (see press releases: October 12, 2011; November 12, 2013; November 3, 2014).

Dr. T.F. Morris, President and CEO of Northern Superior commented: *“Northern Superior management believes that the Inferred Mineral Resource estimates presented by the Optiro Report represent a great start to understanding the gold potential of the CBSZ specifically, and the Croteau Est property as a*

whole. On the CBSZ alone, a tremendous opportunity exists to expand the number of gold ounces within the CBSZ based on the premise that additional exploration may:

- 1) upgrade some of the exploration potential/target of the CBSZ;
- 2) convert part of the Inferred Mineral Resource to Indicated Mineral Resource category by infill drilling of core drill holes, from 50m x 50m to 25m x 25m;
- 3) add additional gold ounces by inclusion of the high grade gold values previously reported from channel samples cut in several trenches at surface within the central part of the CBSZ in future modelling;
- 4) identify potential high grade rods or shoots within the CBSZ (see press release: November 3, 2014) with tighter collar spacing; and
- 5) identify additional gold ounces along strike (east and west) of the central CBSZ and at depth, as the system is open in those directions.”

Management at Northern Superior has always maintained that the CBSZ is a small component of a much larger gold mineralized system on the property, based not only on management’s observations but from those recommendations made from several qualified consultants who have worked on the project. Northern Superior hopes to find a partner that will assist the Company to realize the potential at the CBSZ.”

Optiro Report Recommendations Include:

- Infill drilling of the central section of the CBSZ deposit to 25 x 25m drill hole spacing to potentially upgrade the classification of this area to Indicated Mineral Resource category; and
- Exploration drilling to test along strike extensions of the central CBSZ deposit, in particular on the eastern end of the deposit, where there are three drill holes that have mineralized intervals consistent with the projection of the CBSZ. These intersections may suggest either an isolated zone of mineralization, or continuation of mineralization of an unknown extent along the CBSZ.

Inferred Mineral Resource Classification:

- The Inferred Mineral Resource estimates have been generated from drill hole sample assay results and the interpretation of an integrated 3D geological model that defines the relationships of various geological elements within the CBSZ. The interpreted mineralization wireframes (using a nominal 0.25 ppm Au cut-off grade) have been used to constrain gold grade estimates.
- Block grade estimation parameters have been defined on the basis of geology, drillhole spacing, and through geostatistical analysis of the data. Block grade estimation is by ordinary kriging (OK) into a panel size of 12.5 mE by 2.5 mN on 2.5 mRL, which is considered appropriate for the distribution of sample data and the deposit type.
- The Inferred Mineral Resource estimates have been classified by their proximity to the sample locations and confidence in the block model grade estimate, and have been reported in accordance with the guidelines of the JORC Code (JORC, 2012). The JORC Code was used because the company’s former partner on the project was an ASX and TSX listed company with an Australian head office. The company’s QP (defined below) is confident there are no material differences between JORC Code guidelines regarding inferred mineral resources and those set forth in Standards on Mineral Resources and Reserves of the Canadian Institute of Mining, Metallurgy and Petroleum (CIM, 2010).

- A more detailed description on the modelling and statistical parameters used to determine the Inferred Mineral Resource estimates are provided within the Optiro Report.

Exploration Potential/Target:

The Optiro Report also identified additional mineralized material on the CBSZ which lacked sufficient confidence to be classified as an Inferred Mineral Resource but that the uncertainty with this material is such that with further work, this could change and hence, represents an exploration potential/target. Specifically, the Optiro Report indicates an exploration potential range of 3.2 to 3.8 million tonnes, for a total of 122,000 to 270,000 ounces of gold. To evaluate the exploration potential, the unclassified mineralization above 1.0 g/t cut-off, was tabulated as being above/below 325 m below surface and by lode. Any mineralization associated with lode 1 (the main lode) was incorporated into the exploration potential. The lower range for the minor lode was estimated as follows: (i) below 325 m below surface, lodes greater than 2.0 g/t gold were included as exploration potential; and (ii) above 325 m below surface, lodes greater than 1.5g/t gold were included as exploration potential. The maximum range assumed that with further work, up to 100% of the unclassified mineralization may be upgraded. The Optiro Report further noted that more than 90% of this material is at depths greater than 325 m below surface and that a significant amount of work will be required to improve the confidence for this material. As such, caution must be exercised as the potential quantity and grade is conceptual in nature, there has been insufficient exploration to define a mineral resource and that it is uncertain if further exploration will result in the target being delineated as a mineral resource.

About Northern Superior

Northern Superior is a junior exploration company exploring for gold in the Superior Province of the Canadian Shield. The Company currently has 2 gold properties (Croteau Est, Lac Surprise) and 1 diamond exploration property (Ville Marie) in Québec and 1 gold, silver copper property in Ontario (Ti-pi-haa-kaaning). All these properties are 100% owned and operated by Northern Superior. All properties have core drill- ready targets defined on each. The Company also has one early stage mineral property in Québec, Wapistan. A summary for each of these properties is available on Northern Superior's website (www.nsuperior.com). Northern Superior has identified an additional 22 mineral properties in west-central Québec from its in-house terabyte of geoscientific data.

The disclosure in this press release is based on excerpts taken from the Optiro Report, which was principally authored and certified by Mark Drabble, Principal Consultant at Optiro Pty Limited (B.App.Sci Geology, MAIG, MAusIMM). Mr. Drabble meets the requirements of an "independent" Qualified Person under NI 43-101. The Optiro Report will be filed on SEDAR (www.sedar.com) immediately following dissemination of this news release and will also be posted on Northern Superior's website (www.nsuperior.com). The Company's Qualified Person ("QP") for the Croteau Est property is Ron Avery (P.Ge.). As the QP, Mr. Avery has approved information disclosed in this press release.

Northern Superior is a reporting issuer in British Columbia, Alberta, Ontario and Québec, and trades on the TSX Venture Exchange under the symbol SUP.

Cautionary Note Regarding Mineral Reserves and Mineral Resources: The terms "Mineral Resource", "Indicated Mineral Resource", "Inferred Mineral Resource" used in this release are Canadian mining terms as defined in accordance with National Instrument 43-101 – Standards of Disclosure for Mineral Projects under the guidelines set out in the CIM Standards. Mineral Resources which are not Mineral Reserves do not have demonstrated economic viability.

Cautionary Note Regarding Forward-Looking Statements: This Press Release contains forward-looking statements that involve risks and uncertainties, which may cause actual results to differ materially from the statements made. When used in this document, the words "may", "would", "could", "will", "intend", "plan", "anticipate", "believe", "estimate", "expect" and similar expressions are intended to identify forward-looking statements. Such statements reflect our current views with respect to future events and are subject to such risks and uncertainties. Many factors could cause our actual results to differ materially from the statements made, including those factors discussed in filings made by us with the Canadian securities regulatory authorities. Should one or more of these risks and uncertainties, such actual results of current exploration programs, the general risks associated with the mining industry, the price of gold and other metals, currency and interest rate fluctuations, increased competition and general economic and market factors, occur or should assumptions underlying the forward looking statements prove incorrect, actual results may vary materially from those described herein as intended, planned, anticipated, or expected. We do not intend and do not assume any obligation to update these forward-looking statements, except as required by law. Shareholders are cautioned not to put undue reliance on such forward-looking statements.
